Figures

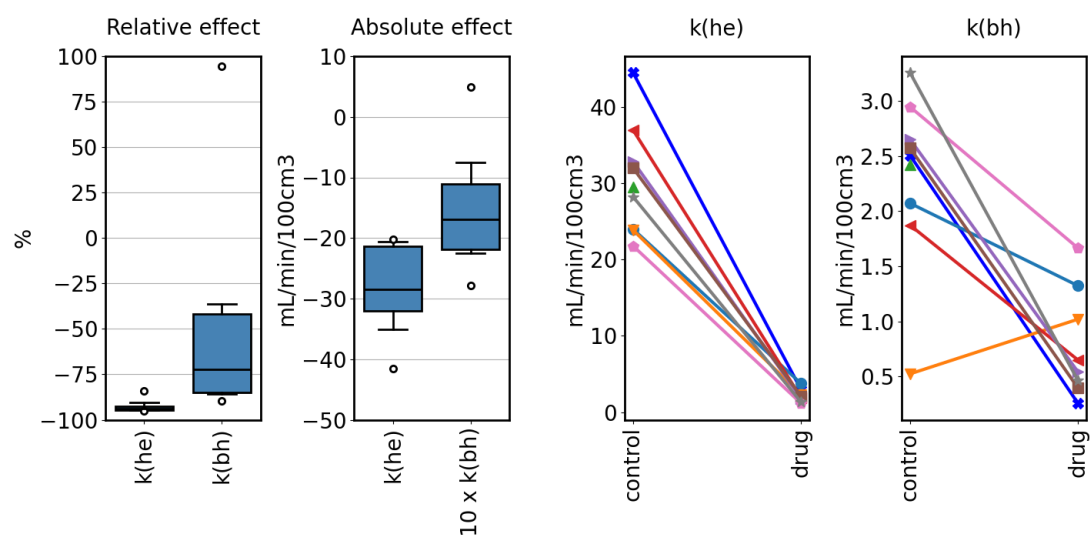

Figure 1.1: Visualisation of the primary endpoints khe and kbh across the population, showing a significant response to drug: (a) the relative and absolute effect size across the population as box plots; and (b) the individual values at control (left of plots) and after single dose of drug (right of plot). Colored lines in (b) represent individual volunteers. Note: absolute effect sizes for kbh have been scaled with a factor 10 to improve visualisation.

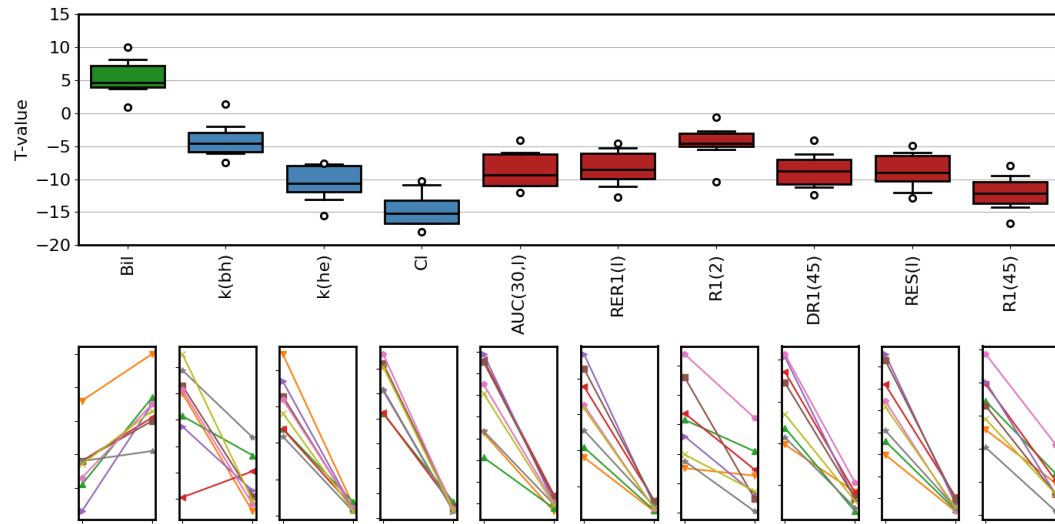

Figure 1.2: drug effect for all parameters that show a significant reduction in the mean value ($p < 0.01$). The top row shows the difference relative to the standard error of the difference, and the bottom row shows the individual effects for the corresponding biomarkers.

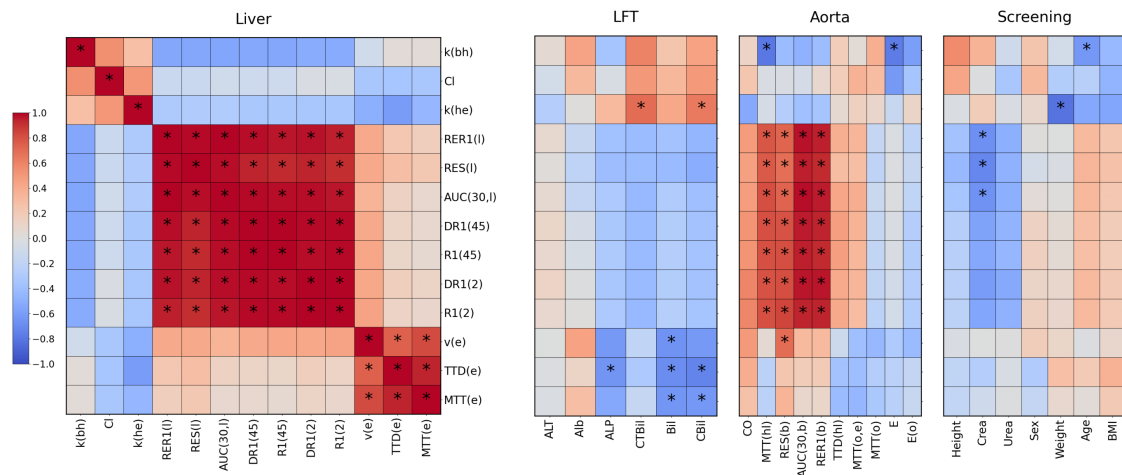

Figure 1.3: Correlations between parameters at control.

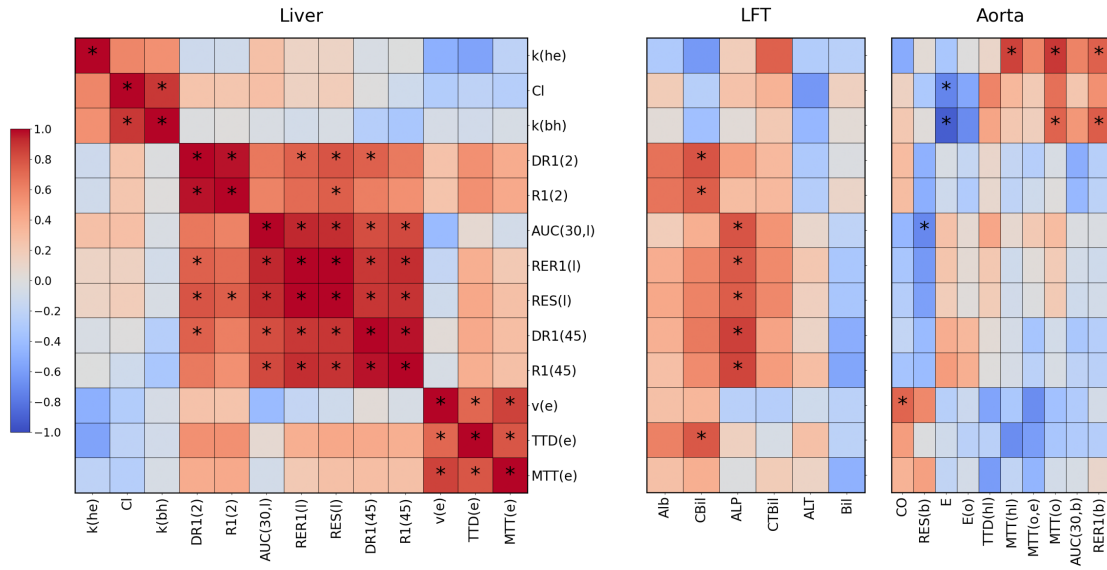

Figure 1.4: Correlations between parameter changes.
